

SecureInsight Awareness services

Increasing awareness and improving the behavior of employees is a continuous process.

An effective security awareness program helps to reduce the risks within an organization by increasing awareness and securing cyber behavior from different interactive perspectives.

Security incidents and data leaks are often caused by employees and are a risk for your organization. However, these risks are not always known or are underestimated. In addition, technology and security measures are perceived as complex and restrictive, and may be circumvented.

Employees often act subconsciously and are therefore vulnerable to malicious parties. These parties use social engineering methods such as phishing and pre-texting to gain access to information, systems, data and buildings via employees in order to achieve their goals. In addition to this threat, laws and regulations necessitate the need to be in control and ensure that employees are cyber-aware.

Security awareness challenges

- Employees are the 'human endpoint' of the IT environment and are vulnerable to malicious attacks.
- Organizations must mitigate risks by promoting awareness and safe behavior among employees.
- Insight into results, and progress of awareness and behavior, is necessary to be in control.

Ad hoc attention to security awareness, after an incident or a single news item for example, has no lasting result.

In order to develop and safeguard safe behavior among employees, three pillars are important: motivation, capacity and situation.

1. Motivation

Employees are more motivated when the information security risks are clear and understandable. Insight into the risks is the first step towards behavioral change. This applies not only in professional situations, but also in private.

2. Capacity

Allowing employees to develop insight and knowledge in a controlled environment increases awareness and resilience. This means regular training and practice with real and recognizable situations.

3. Situation

Employees must be aware and educated in order to apply safe behavior. It concerns the functional support of employees to avoid risks.

Pro
Training

Benefits:

- Significantly reduce risks of falling victim to social engineering tactics which are hard to detect or prevent by even the best security tools
- Ensure compliance with certification standards or laws like the GDPR
- Added benefit for employees: stay up to date on important security topics
- Detailed documentation: verify and confirm that everyone has taken their due courses
- Develop a security-first mindset that leads to an improved resilience towards cyber risks in general

Security awareness program

A security awareness program aims to teach employees how to safely implement cyber security behavior and to apply them. By offering this in various and interactive ways, employees develop insight and knowledge to recognize risks and how to act in different situations.

We recommend setting up a one-year or multi-year training program in which insight, awareness and training are carried out in different ways. The content and composition of the program depend on the situation and objectives of your organization. The different options are explained in the table above.

Secureinsight awareness services

From our SecureInsight Awareness Services a security awareness program can be set up, consisting of a combination of online and onsite services supplemented with program support.

The choice and coherence of the services lets you create a program that is appropriate for your organization, and the progress and results of the program are measurable and transparent.
